

# Iterate Over an Array to Log Messages to Console

Work with a partner to implement the following user story:

- As a member of the class, I want to store a list of my classmates and use that list to create a greeting for each student on the list.

## Acceptance Criteria

---

- It's done when the names of five classmates are stored in a single variable named `students`.
- It's done when the total number of elements in the `students` array is logged to the console.
- It's done when, using a `for` loop, the greeting "Great to see you, CLASSMATE\_NAME!" logs to the console for each classmate's name in the `students` array.

## Hints

---

How can you access each element using the element's index and the array name?

## Bonus

---

If you have completed this activity, work through the following challenge with your partner to further your knowledge:

- What's a `while` loop?

Use [Google](https://www.google.com) or another search engine to research this.
